France work authorization: Student visa (VLS-TS) • Availability: August 2026

Profile

Backend engineer specializing in distributed systems and reliability. 4+ years at Thriwe leading architecture for core microservices handling 2–3M users, processing 5K+ events/second, and serving enterprise clients (HSBC, Mastercard). Driven by learning-pivoted from iOS to backend within months. Now pursuing Master's in distributed systems at EPITA; seeking August 2026 internship to combine production experience with academic rigor.

Education

Master of Science in Computer Science

EPITA (École pour l'Informatique et les Techniques Avancées), Paris, France

• **Relevant Coursework:** Advanced Algorithms, Distributed Systems, Cloud Computing, System Design.

Expected Graduation: Sept 2026

Bachelor of Technology in Electronics & Communications

Jaypee Institute of Information Technology, Noida, India

2017 – 2021

Technical Skills

Languages

Go, Python, JavaScript/TypeScript, SQL, C/C++

Distributed Systems

Concurrency (goroutines, channels), Microservices, event-driven architecture, circuit breakers, idempotency, DLQs

Cloud & Infrastructure

AWS (Lambda, SNS, SES, SQS, EventBridge, EC2, EKS, CloudWatch), Docker, Terraform, Linux

Backend & Data

PostgreSQL, PostGIS, Redis, Kafka, gRPC, REST, GraphQL, Protocol Buffers

DevOps & Tools

Git, GitHub Actions, CI/CD, Docker Compose, Makefiles

Languages

English

Fluent (C1)

French

A2 (Enrolled in Intensive B1 course)

Professional Skills

Technical Leadership
System Design & Architecture
Mentoring & Onboarding
Agile / Sprint Planning
Stakeholder Communication
Cross-team Collaboration

Professional Experience

Software Engineer

June 2021 – Aug 2025

Thriwe (Benefits-as-a-Service), Delhi, India

- **Career pivot:** Transitioned from iOS/Swift to backend Go development; became lead architect on 4 core services (Notification, Discovery, Admin, Inventory) within months.
- **Monolith migration:** Led decomposition of a PHP monolith into **10 bounded microservices**; redesigned data boundaries, cross-service pagination, and service contracts. Critical API response times improved by **30%**.
- **Notification platform:** Architected a centralized notification service (SNS → EventBridge → SQS → Lambda) handling **10K+ messages/day** across SMS, Email, and WhatsApp. Added circuit breakers per channel, idempotency keys, and DLQs to sustain **99.9% availability**.
- **Event-driven analytics:** Designed Kafka pipelines processing **5K+ events/s** with manual offset commits, consumer lag monitoring, and idempotent processing for near real-time dashboards for HSBC and Mastercard.
- **CI/CD & developer productivity:** Built CI/CD with Docker + GitHub Actions, reducing deployment time from 45 min to **15 min**. Standardized local dev environments with Docker Compose; cut onboarding from 2 weeks to **2 days**.
- **Security & APIs:** Delivered stateless services with JWT auth, RBAC, and vendor API integrations for enterprise benefits programs.

Projects

Forest BD Viewer (Go, Next.js, PostGIS, Redis, Docker)

[\[GitHub\]](#)

Full-stack geospatial platform for exploring French forest ecosystems with interactive map visualization.

- Go backend (Echo + gqlgen GraphQL), JWT auth, and MVT tile serving from PostGIS with Redis caching.
- Concurrent LiDAR data fetching via goroutines (16MB chunks) to handle large-region requests.
- Next.js frontend with Mapbox GL JS; polygon analysis tool for forest coverage and species breakdowns.
- Progressive zoom disclosure: region → department → commune → parcels. Multi-language (EN/FR).

Command Shell (Go)

[\[GitHub\]](#)

POSIX-compliant shell built from scratch using raw system calls (`fork`, `exec`, `wait`) – no `os/exec`.

- Pipe chains (`|`), I/O redirection, background execution, and job control.
- Signal handling (`SIGINT`, `SIGTSTP`), process groups, and file descriptor inheritance.
